

## EXTENDER OF INFRARED SIGNAL CONTROL IRE-102

Ire -102 controller provides control of tape recorder, even when they are installed in inaccessible places for penetration infrared rays, for example, in the glove compartment.

Flexible control system:

- can serve as a remote "eye" (receiver) of ir control signals, if such input is stipulated in the cassette;
- control of radio-recorder can be carried out at a low frequency (direct and inverse) and with the help of infrared diode (included in delivery).

Connection:

Red wire - supply +12 v.

Black wire - negative (ground connection).

White wire - is designed to connect + (anode) infrared emitting diode (long stem);

Yellow wire - is designed for connection - (cathode) of the ir emitting diode (short stem,);

Blue wire - inverted output of signal without carrier;

Green wire - the output of signal without the carrier.
